

The first Oriental species of the genus *Brachyopa* MEIGEN (Diptera: Syrphidae), with a discussion on the Syrphidae fauna of the Indo-Malayan transition zone

[Die erste orientalische Art aus der Gattung *Brachyopa* MEIGEN
(Diptera: Syrphidae), mit einer Diskussion über die Schwebfliegenfauna
der indo-malayischen Übergangszone]

Abstract

The genus *Brachyopa* MEIGEN, 1822 is recorded from the Oriental region for the first time. *Brachyopa exigua* spec. nov. is described from Kambaiti, Myanmar. One additional male is known from Thailand. The new species is compared with similar *Brachyopa* species from the Palaearctic region. The reason why the Kambaiti area is a transition zone between the Palaearctic and Oriental fauna is discussed.

Key words

Syrphidae, *Brachyopa*, Oriental Region, Indo-Malay biodiversity hotspot, transition zone, new species

Zusammenfassung

Die Gattung *Brachyopa* MEIGEN, 1822 wurde in der orientalischen Region zum ersten Mal nachgewiesen. *Brachyopa exigua* spec. nov. wird aus Kambaiti, Myanmar beschrieben. Ein zusätzliches Männchen ist aus Thailand bekannt. Die neue Art wird mit ähnlichen *Brachyopa*-Arten aus der paläarktischen Region verglichen. Der Grund, warum das Kambaiti-Gebiet eine Übergangszone zwischen der paläarktischen und orientalischen Fauna ist, wird diskutiert.

Stichwörter

Syrphidae, *Brachyopa*, orientalische Region, indo-malayischer Biodiversitätshotspot, Übergangszone, neue Art

Introduction

The genus *Brachyopa* MEIGEN, 1822 [with *Musca conica* PANZER, 1798 as type species; designated by WESTWOOD (1840)] is a Holarctic genus with 40 described species of which 12 are Nearctic and 28 Palaearctic, without any Holarctic species (PAPE & THOMPSON 2015, VAN STEENIS & VAN STEENIS 2014). The species of *Brachyopa* occur in coniferous and deciduous broadleaved forest. The larvae live in a diverse array of decaying or exuding tree sap in dead or living trees (MCLEAN & STUBBS 1990; ROTHERAY 1991, 1996; KRIVOSHEINA 2005; SIVOVA et al. 1999; RICARTE et al. 2013). The males can be seen patrolling trees with supposed sap runs, defending a territory and looking for females to copulate with. Flowers visited are mostly “open” flowers like Apiaceae, *Prunus*, *Crataegus* and Aceraceae (*Acer*).

The species of the genus *Brachyopa* are distinguished from other Syrphidae by the following combination of characters: Size small to medium (5–10 mm); colour mainly brown, brown-red or black; postpronotum pilose; basoflagellomere round to oval, often with clearly visible sensory pit; vein R_{4+5} straight; cross vein $r-m$ before middle of discal cell and vein $t-m$ oblique to vein R_{4+5} (TORP 1994, REEMER et al. 2009). In the field the flies resemble dung-flies (Scatophagidae).

There has been no cladistic analyses of the genus and only PELLMANN (1998) and DOCZKAL & DZIOCK (2004) tentatively assigned species to certain groups. KASSEBEER (2001) erected a new subgenus (*Trichobrachyopa*),
